

INDOLE DERIVATIVES AND USE THEREOF AS KINASE INHIBITORS IN PARTICULAR IKK2
INHIBITORS**BACKGROUND OF THE INVENTION**

5 The present invention relates to indole carboxamide derivatives, compositions and medicaments containing the same, as well as processes for the preparation and use of such compounds, compositions and medicaments. Such indole carboxamide derivatives may be useful in the treatment of diseases associated with inappropriate IKK2 (also known as IKK β) activity, in particular in the treatment and prevention of disease states
10 mediated by IKK2 mechanisms including inflammatory and tissue repair disorders, particularly rheumatoid arthritis, inflammatory bowel disease, asthma and COPD (chronic obstructive pulmonary disease); osteoarthritis, osteoporosis and fibrotic diseases; dermatosis, including psoriasis, atopic dermatitis and ultraviolet radiation (UV)-induced skin damage; autoimmune diseases including systemic lupus erythematosus, multiple
15 sclerosis, psoriatic arthritis, ankylosing spondylitis, tissue and organ rejection, Alzheimer's disease, stroke, atherosclerosis, restenosis, diabetes, glomerulonephritis, cancer, including Hodgkins disease, cachexia, inflammation associated with infection and certain viral infections, including acquired immune deficiency syndrome (AIDS), adult respiratory distress syndrome, and Ataxia Telangiectasia.

An important large family of enzymes is the protein kinase enzyme family. Currently, there are about 500 different known protein kinases. However, because three to four percent of the human genome is a code for the formation of protein kinases, there may be many thousands of distinct and separate kinases in the human body. Protein kinases
25 serve to catalyze the phosphorylation of an amino acid side chain in various proteins by the transfer of the γ -phosphate of the ATP-Mg²⁺ complex to said amino acid side chain. These enzymes control the majority of the signaling processes inside cells, thereby governing cell function, growth, differentiation and destruction (apoptosis) through reversible phosphorylation of the hydroxyl groups of serine, threonine and tyrosine
30 residues in proteins. Studies have shown that protein kinases are key regulators of many cell functions, including signal transduction, transcriptional regulation, cell motility, and cell division. Several oncogenes have also been shown to encode protein kinases, suggesting that kinases play a role in oncogenesis. These processes are highly regulated, often by complex intermeshed pathways where each kinase will itself be regulated by one or more
35 kinases. Consequently, aberrant or inappropriate protein kinase activity can contribute to the rise of disease states associated with such aberrant kinase activity. Due to their

physiological relevance, variety and ubiquitousness, protein kinases have become one of the most important and widely studied family of enzymes in biochemical and medical research.

The protein kinase family of enzymes is typically classified into two main subfamilies: Protein Tyrosine Kinases and Protein Serine/Threonine Kinases, based on the amino acid residue they phosphorylate. The serine/threonine kinases (PSTK), includes cyclic AMP- and cyclic GMP-dependent protein kinases, calcium and phospholipid dependent protein kinase, calcium- and calmodulin-dependent protein kinases, casein kinases, cell division cycle protein kinases and others. These kinases are usually cytoplasmic or associated with the particulate fractions of cells, possibly by anchoring proteins. Aberrant protein serine/threonine kinase activity has been implicated or is suspected in a number of pathologies such as rheumatoid arthritis, psoriasis, septic shock, bone loss, many cancers and other proliferative diseases. Accordingly, serine/threonine kinases and the signal transduction pathways which they are part of are important targets for drug design. The tyrosine kinases phosphorylate tyrosine residues. Tyrosine kinases play an equally important role in cell regulation. These kinases include several receptors for molecules such as growth factors and hormones, including epidermal growth factor receptor, insulin receptor, platelet derived growth factor receptor and others. Studies have indicated that many tyrosine kinases are transmembrane proteins with their receptor domains located on the outside of the cell and their kinase domains on the inside. Much work is also under progress to identify modulators of tyrosine kinases as well.

Nuclear factor κ B (NF- κ B) belongs to a family of closely related dimeric transcription factor complexes composed of various combinations of the Rel/NF- κ B family of polypeptides. The family consists of five individual gene products in mammals, RelA (p65), NF- κ B1 (p50/ p105), NF- κ B2 (p49/ p100), c-Rel, and RelB, all of which can form hetero- or homodimers. These proteins share a highly homologous 300 amino acid "Rel homology domain" which contains the DNA binding and dimerization domains. At the extreme C-terminus of the Rel homology domain is a nuclear translocation sequence important in the transport of NF- κ B from the cytoplasm to the nucleus. In addition, p65 and cRel possess potent transactivation domains at their C-terminal ends.

The activity of NF- κ B is regulated by its interaction with a member of the inhibitor I κ B family of proteins. This interaction effectively blocks the nuclear localization sequence on

the NF- κ B proteins, thus preventing migration of the dimer to the nucleus. A wide variety of stimuli activate NF- κ B through what are likely to be multiple signal transduction pathways. Included are bacterial products (LPS), some viruses (HIV-1, HTLV-1), inflammatory cytokines (TNF α , IL-1), environmental and oxidative stress and DNA damaging agents. Apparently common to all stimuli however, is the phosphorylation and subsequent degradation of I κ B. I κ B is phosphorylated on two N-terminal serines by the recently identified I κ B kinases (IKK- α and IKK- β). IKK- β is also known as IKK2. Site-directed mutagenesis studies indicate that these phosphorylations are critical for the subsequent activation of NF- κ B in that once phosphorylated the protein is flagged for degradation via the ubiquitin-proteasome pathway. Free from I κ B, the active NF- κ B complexes are able to translocate to the nucleus where they bind in a selective manner to preferred gene-specific enhancer sequences. Included in the genes regulated by NF- κ B are a number of cytokines and chemokines, cell adhesion molecules, acute phase proteins, immunoregulatory proteins, eicosanoid metabolizing enzymes and anti-apoptotic genes.

It is well-known that NF- κ B plays a key role in the regulated expression of a large number of pro-inflammatory mediators including cytokines such as TNF, IL-1 β , IL-6 and IL-8, cell adhesion molecules, such as ICAM and VCAM, and inducible nitric oxide synthase (iNOS). Such mediators are known to play a role in the recruitment of leukocytes at sites of inflammation and in the case of iNOS, may lead to organ destruction in some inflammatory and autoimmune diseases.

The importance of NF- κ B in inflammatory disorders is further strengthened by studies of airway inflammation including asthma, in which NF- κ B has been shown to be activated. This activation may underlie the increased cytokine production and leukocyte infiltration characteristic of these disorders. In addition, inhaled steroids are known to reduce airway hyperresponsiveness and suppress the inflammatory response in asthmatic airways. In light of the recent findings with regard to glucocorticoid inhibition of NF- κ B, one may speculate that these effects are mediated through an inhibition of NF- κ B.

Further evidence for a role of NF- κ B in inflammatory disorders comes from studies of rheumatoid synovium. Although NF- κ B is normally present as an inactive cytoplasmic complex, recent immunohistochemical studies have indicated that NF- κ B is present in the nuclei, and hence active, in the cells comprising rheumatoid synovium. Furthermore, NF-

κ B has been shown to be activated in human synovial cells in response to stimulation with TNF- α or IL-1 β . Such a distribution may be the underlying mechanism for the increased cytokine and eicosanoid production characteristic of this tissue. See Roshak, A. K., et al., *J. Biol. Chem.*, 271, 31496-31501 (1996). Expression of IKK- β has been shown in synoviocytes of rheumatoid arthritis patients and gene transfer studies have demonstrated the central role of IKK- β in stimulated inflammatory mediator production in these cells. See Aupperle et al. *J. Immunology* 1999, 163:427-433 and Aupperle et al. *J. Immunology* 2001;166:2705-11. More recently, the intra-articular administration of a wild type IKK- β adenoviral construct was shown to cause paw swelling while intra-articular administration of dominant-negative IKK β inhibited adjuvant-induced arthritis in rat. See Tak et al. *Arthritis and Rheumatism* 2001, 44:1897-1907.

The NF- κ B/Rel and I κ B proteins are also likely to play a key role in neoplastic transformation and metastasis. Family members are associated with cell transformation *in vitro* and *in vivo* as a result of over expression, gene amplification, gene rearrangements or translocations. In addition, rearrangement and/or amplification of the genes encoding these proteins are seen in 20-25% of certain human lymphoid tumors. Further, NF- κ B is activated by oncogenic ras, the most common defect in human tumors and blockade of NF- κ B activation inhibits ras mediated cell transformation. In addition, a role for NF- κ B in the regulation of apoptosis has been reported strengthening the role of this transcription factor in the regulation of tumor cell proliferation. TNF, ionizing radiation and DNA damaging agents have all been shown to activate NF- κ B which in turn leads to the upregulated expression of several anti-apoptotic proteins. Conversely, inhibition of NF- κ B has been shown to enhance apoptotic-killing by these agents in several tumor cell types. As this likely represents a major mechanism of tumor cell resistance to chemotherapy, inhibitors of NF- κ B activation may be useful chemotherapeutic agents as either single agents or adjunct therapy. Recent reports have implicated NF- κ B as an inhibitor of skeletal cell differentiation as well as a regulator of cytokine-induced muscle wasting (Guttridge et al. *Science*; 2000; 289: 2363-2365.) further supporting the potential of NF κ B inhibitors as novel cancer therapies.

Several NF- κ B inhibitors are described in C. Wahl, et al. *J. Clin. Invest.* 101(5), 1163-1174 (1998), R. W. Sullivan, et al. *J. Med. Chem.* 41, 413-419 (1998), J. W. Pierce, et al. *J. Biol. Chem.* 272, 21096-21103 (1997).

The marine natural product hymenialdisine is known to inhibit NF- κ B. Roshak, A., *et al.*, *JPET*, 283, 955-961 (1997). Breton, J. J and Chabot-Fletcher, M. C., *JPET*, 282, 459-466 (1997).

Additionally, patent applications have been filed on aminothiophene inhibitors of the IKK2, see Callahan, *et al.*, WO 2002030353; Baxter, *et al.*, WO 2001058890, Faull, *et al.*, WO 2003010158; Griffiths, *et al.*, WO2003010163; Fancelli, *et al.*, WO 200198290; imidazole inhibitors of IKK2, see Callahan, *et al.*, WO 200230423; anilinophenylpyrimidine inhibitors of IKK2, see Kois, *et al.*, WO 2002046171; β -carboline inhibitors of IKK2, see Ritzeler, *et al.*, WO 2001068648, Ritzeler, *et al.*, EP 1134221; Nielsch, *et al.* DE 19807993; Ritzeler, *et al.*, EP 1209158; indole inhibitors of IKK2, see Ritzeler, *et al.*, WO 2001030774; benzimidazole inhibitors of the IKK2, see Ritzeler, *et al.*, DE 19928424; Ritzeler *et al.*, WO 2001000610; aminopyridine inhibitors of IKK2, see Lowinger, *et al.*, WO 2002024679; Murata, *et al.*, WO 2002024693; Murata, *et al.*, WO 2002044153; pyrazolaquinazoline inhibitors of IKK2, see Beaulieu, *et al.*, WO 2002028860; Burke *et al.*, WO 2002060386, Burke, *et al.* US 20030022898; quinoline inhibitors of IKK2, Browner, *et al.*, WO2002041843, Browner, *et al.*, US 20020161004 and pyridylcyanoguanidine inhibitors of IKK2, see Bjorkling, *et al.*, WO 2002094813, Binderup *et al.*, WO 2002094322 and Madsen, *et al.*, WO 200294265. The natural products staurosporine, quercetin, K252a and K252b have been shown to be IKK2 inhibitors, see Peet, G. W. and Li, J. J. *Biol. Chem.*, 278, 1450-1456 (2003) and Murata, *et al.*, *Bioorg. Med. Chem. Lett.*, 13, 913-198 (2003) have described IKK2 inhibitors.

The present inventors have identified novel indole carboxamide compounds, which are inhibitors of kinase activity, in particular IKK2 activity. Such indole carboxamide derivatives are therefore of potential benefit in the treatment of disorders associated with inappropriate kinase, suitably inappropriate IKK2 activity, in particular in the treatment and prevention of disease states mediated by IKK2 mechanisms including inflammatory and tissue repair disorders, particularly rheumatoid arthritis, inflammatory bowel disease, asthma and COPD (chronic obstructive pulmonary disease); osteoarthritis, osteoporosis and fibrotic diseases; dermatosis, including psoriasis, atopic dermatitis and ultraviolet radiation (UV)-induced skin damage; autoimmune diseases including systemic lupus erythematosus, multiple sclerosis, psoriatic arthritis, ankylosing spondylitis, tissue and organ rejection, Alzheimer's disease, stroke, atherosclerosis, restenosis, diabetes,

glomerulonephritis, cancer, including Hodgkins disease, cachexia, inflammation associated with infection and certain viral infections, including acquired immune deficiency syndrome (AIDS), adult respiratory distress syndrome, and Ataxia Telangiectasia.

BRIEF SUMMARY OF THE INVENTION

In one aspect of the present invention, there is provided a compound of Formula (I):

wherein R^1 represents H, halogen, or a group -YZ;

Y represents a bond (i.e. is absent), C_{1-6} alkylene or C_{2-6} alkenylene;

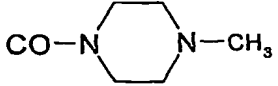

Z represents an aryl or heteroaryl group each comprising 5-14 ring members, said aryl or heteroaryl being optionally substituted by one or more substituents independently selected from halogen, OH, C_{1-6} alkyl, C_{1-6} haloalkyl, C_{1-6} alkoxy, C_{1-6} haloalkoxy, CN, C_{1-6} hydroxyalkyl, phenyl, O-(CH₂)₁₋₆-phenyl, NHSO₂R³, NHCOR³, CONR⁴R⁵, SO₂NR⁴R⁵;

R³, R⁴ and R⁵ independently represent H or C_{1-6} alkyl;

R² represents H, halogen or a group -Y¹Z¹;

Y¹ represents a bond (i.e. is absent), C_{1-6} alkylene, C_{2-6} alkenylene;

Z¹ represents a 6 membered aryl, 5 or 6 membered heteroaryl, 5 - 7 membered heterocyclyl, C₅₋₇ cycloalkyl, C₅₋₇ cycloalkenyl, each of which may be optionally substituted by one or more substituents independently selected from SO₂R⁶,

 , COR⁷, NR⁷R⁸, SO₂NR⁷R⁸, C_{1-6} alkyl, C_{1-6} haloalkyl, C_{1-6} alkoxy, C_{1-6} haloalkoxy, halogen, CONR⁷R⁸, NHCOR⁷, or phenyl (directly attached or attached by a C_{1-6} alkylene, CONH, C_{2-6} alkenylene spacer and

optionally substituted by one or more substituent selected from

, C₁₋₆ alkyl, C₁₋₆ alkoxy, C₁₋₆ haloalkyl, C₁₋₆ haloalkoxy, OH, halogen);

R⁶ represents H, C₁₋₆ alkyl, -(CH₂)_n phenyl or -(CH₂)_n naphthyl (where n is 0 or 1 and each of which phenyl or naphthyl may be optionally substituted by one or more substituents independently selected from C₁₋₆ alkyl, C₁₋₆ alkoxy, halogen, NR⁷R⁸, C₁₋₆ haloalkyl, C₁₋₆ haloalkoxy), CN or -(O)_p phenyl (where p is 0 or 1 and the phenyl is optionally substituted by one or more substituents independently selected from halogen, C₁₋₆ alkyl or C₁₋₆ alkoxy));

R⁷ and R⁸ independently represents C₁₋₆ alkyl, H, C₁₋₆ alkylene NR⁹R¹⁰;

R⁹ and R¹⁰ independently represents C₁₋₆ alkyl, H;

with the proviso R¹ and R² do not both represent H;

or a salt, solvate, or physiologically functional derivative thereof.

In a second aspect of the present invention, there is provided a compound of formula (I), or a salt, solvate, or a physiologically functional derivative thereof for use in therapy, in particular in the treatment of a disorder associated with inappropriate kinase, in particular inappropriate IKK2 activity.

In a third aspect of the present invention, there is provided a pharmaceutical composition comprising a therapeutically effective amount of a compound of formula (I) or a salt, solvate, or a physiologically functional derivative thereof and one or more of pharmaceutically acceptable carriers, diluents and excipients.

In a fourth aspect of the present invention, there is provided a method of treating a disorder in a mammal, said disorder being mediated by inappropriate IKK2 activity, comprising administering to said mammal a compound of formula (I) or a salt, solvate or a physiologically functional derivative thereof.

In a fifth aspect of the present invention, there is provided the use of a compound of formula (I), or a salt, solvate, or a physiologically functional derivative thereof in the preparation of a medicament for use in the treatment of a disorder mediated by inappropriate IKK2 activity.

In a sixth aspect there is provided a method of treating inflammatory and tissue repair disorders, particularly rheumatoid arthritis, inflammatory bowel disease, asthma and COPD (chronic obstructive pulmonary disease); osteoarthritis, osteoporosis and fibrotic diseases; dermatosis, including psoriasis, atopic dermatitis and ultraviolet radiation (UV)-induced skin damage; autoimmune diseases including systemic lupus erythematosus, multiple sclerosis, psoriatic arthritis, ankylosing spondylitis, tissue and organ rejection, Alzheimer's disease, stroke, atherosclerosis, restenosis, diabetes, glomerulonephritis, cancer, including Hodgkins disease, cachexia, inflammation associated with infection and certain viral infections, including acquired immune deficiency syndrome (AIDS), adult respiratory distress syndrome, and Ataxia Telangiectasia, comprising administering a compound of formula (I), or a salt, solvate or pharmaceutically functional derivative thereof.

In a seventh aspect there is provided the use of a compound of formula (I) or a salt, solvate or physiologically functional derivative thereof in the manufacture of a medicament for the treatment of inflammatory and tissue repair disorders, particularly rheumatoid arthritis, inflammatory bowel disease, asthma and COPD (chronic obstructive pulmonary disease); osteoarthritis, osteoporosis and fibrotic diseases; dermatosis, including psoriasis, atopic dermatitis and ultraviolet radiation (UV)-induced skin damage; autoimmune diseases including systemic lupus erythematosus, multiple sclerosis, psoriatic arthritis, ankylosing spondylitis, tissue and organ rejection, Alzheimer's disease, stroke, atherosclerosis, restenosis, diabetes, glomerulonephritis, cancer, including Hodgkins disease, cachexia, inflammation associated with infection and certain viral infections, including acquired immune deficiency syndrome (AIDS), adult respiratory distress syndrome, and Ataxia Telangiectasia.

DETAILED DESCRIPTION OF THE INVENTION

As used herein, the term "effective amount" means that amount of a drug or pharmaceutical agent that will elicit the biological or medical response of a tissue, system, animal or human that is being sought, for instance, by a researcher or clinician.

Furthermore, the term "therapeutically effective amount" means any amount which, as compared to a corresponding subject who has not received such amount, results in improved treatment, healing, prevention, or amelioration of a disease, disorder, or side effect, or a decrease in the rate of advancement of a disease or disorder. The term also includes within its scope amounts effective to enhance normal physiological function.

As used herein "a compound of the invention" or "a compound of formula (I) means a compound of formula (I) or a pharmaceutically acceptable salt, solvate or physiologically functional derivative thereof.

As used herein the term "alkyl" refers to a straight- or branched-chain hydrocarbon radical having the specified number of carbon atoms, so for example, as used herein, the terms "C₁-C₃ alkyl" and "C₁-C₆ alkyl" refer to an alkyl group, as defined above, containing at least 1, and at most 3 or 6 carbon atoms respectively. Examples of such branched or straight-chained alkyl groups useful in the present invention include, but are not limited to, methyl, ethyl, n-propyl, isopropyl, isobutyl, n-butyl, t-butyl, n-pentyl, isopentyl, and n-hexyl.

As used herein, the term "alkylene" refers to a straight or branched chain divalent hydrocarbon radical having the specified number of carbon atom, so for example, as used herein, the terms "C₁-C₃ alkylene" and "C₁-C₆ alkylene" refer to an alkylene group, as defined above, which contains at least 1, and at most 3 or 6, carbon atoms respectively. Examples of "C₁-C₆ alkylene" and "C₁-C₆ alkylene" groups useful in the present invention include, but are not limited to, methylene, ethylene, n-propylene, n-butylenes, isopentylene, and the like.

As used herein, the term "alkenyl" (and "alkenylene") refers to straight or branched hydrocarbon chains containing the specified number of carbon atoms and at least one and up to 3 carbon-carbon double bonds. Examples include ethenyl (and ethenylene) and propenyl (and propenylene).

As used herein, the term "halogen" refers to fluorine (F), chlorine (Cl), bromine (Br), or iodine (I) and the term "halo" refers to the halogen radicals: fluoro (-F), chloro (-Cl), bromo(-Br), and iodo(-I).

As used herein, the term "C₁-C₆ haloalkyl" refers to a straight or branched chain alkyl group as defined above containing at least 1, and at most 6 carbon atoms respectively

substituted with at least one halo group, halo being as defined herein. Examples of such branched or straight chained haloalkyl groups useful in the present invention include, but are not limited to, methyl, ethyl, propyl, isopropyl, isobutyl and n-butyl substituted independently with one or more halos, *e.g.*, fluoro, chloro, bromo and iodo.

As used herein, the term "cycloalkyl" refers to a non-aromatic cyclic hydrocarbon ring containing the specified number of carbon atoms so, for example, the term "C₅-C₇ cycloalkyl" refers to a non-aromatic cyclic hydrocarbon ring having from five to seven carbon atoms. Exemplary "C₅-C₇ cycloalkyl" groups useful in the present invention include, but are not limited to, cyclopentyl, cyclohexyl and cycloheptyl.

As used herein, the term "cycloalkenyl" refers to a non-aromatic monocyclic carbocyclic ring having the specified number of carbon atoms and up to 3 carbon-carbon double bonds. "Cycloalkenyl" includes by way of example cyclopentenyl and cyclohexenyl.

As used herein, the term "heterocyclic" or the term "heterocyclyl" refers to a non-aromatic heterocyclic ring containing the specified number ring atoms being saturated or having one or more degrees of unsaturation, containing one or more heteroatom substitutions selected from O and/or N. Such a ring may be optionally fused to one or more other "heterocyclic" ring(s) or cycloalkyl ring(s). Examples of "heterocyclic" moieties include, but are not limited to, tetrahydrofuran, pyran, 1,4-dioxane, 1,3-dioxane, piperidine, piperazine, 2,4-piperazinedione, pyrrolidine, imidazolidine, pyrazolidine, morpholine, thiomorpholine, tetrahydrothiopyran, tetrahydrothiophene, and the like.

As used herein, the term "aryl" refers to monocyclic carbocyclic groups and fused bicyclic carbocyclic groups having the specified number of carbon atoms and having at least one aromatic ring. Examples of aryl groups include phenyl and naphthyl.

As used herein, the term "heteroaryl" refers to an aromatic monocyclic ring, or to a fused bicyclic or tricyclic ring system wherein at least one ring is aromatic, having the specified number of ring atoms and containing at least one heteroatom selected from N, O, and/or S. Examples of "heteroaryl" groups used herein include furanyl, thiophenyl, pyrrolyl, imidazolyl, pyrazolyl, triazolyl, tetrazolyl, thiazolyl, oxazolyl, isoxazolyl, oxadiazolyl, oxopyridyl, thiadiazolyl, isothiazolyl, pyridyl, pyridazyl, pyrazinyl, pyrimidyl, quinolinyl, isoquinolinyl, benzofuranyl, benzothiophenyl, indolyl, indazolyl.

As used herein, the term "alkoxy" refers to the group R_aO- , where R_a is alkyl as defined above and the terms " C_{1-3} alkoxy" and " C_{1-6} alkoxy" refer to an alkoxy group as defined herein wherein the alkyl moiety contains at least 1, and at most 3 or 6, carbon atoms. Exemplary " C_{1-3} alkoxy" and " C_{1-6} alkoxy" groups useful in the present invention include, but are not limited to, methoxy, ethoxy, n-propoxy, isopropoxy, n-butoxy, and t-butoxy.

As used herein the term "hydroxyalkyl" refers to the group $-R_aOH$, where R_a is an alkylene group as defined above.

As used herein, the term "haloalkoxy" refers to the group R_aO- , where R_a is haloalkyl as defined above and the term " C_{1-6} haloalkoxy" refers to a haloalkoxy group as defined herein wherein the haloalkyl moiety contains at least 1, and at most 6, carbon atoms. Exemplary C_{1-6} haloalkoxy groups useful in the present invention include, but is not limited to, trifluoromethoxy.

In one embodiment R^1 is $-YZ$.

In one embodiment Y is a bond (i.e. is absent) or $-\text{CH}=\text{CH}-$. In a particular aspect, Y is a bond.

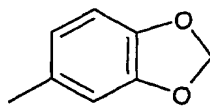

In one embodiment, Z is phenyl (which may be unsubstituted or substituted once or twice with substituents independently selected from C_{1-3} alkoxy, CN, OH, phenyl, $-\text{OCH}_2$ phenyl, NHSO_2R^3 , NHCOR^3 , CONR^4R^5 , $\text{SO}_2\text{NR}^4\text{R}^5$, halogen, C_{1-3} hydroxyalkyl, C_{1-4} alkyl) or a

heteroaryl group selected from benzofuranyl, quinolinyl, pyrimidinyl, thiophenyl, benzothiophenyl, isoxazolyl, pyridinyl (each of which may be optionally substituted by one or two groups independently selected from C_{1-3} alkyl, C_{1-3} alkoxy, halogen).

In a further embodiment, Z is phenyl (which is unsubstituted or substituted once by a substituent selected from phenyl, OCH_2 phenyl, NHSO_2CH_3 , NHCOCH_3 , CONH_2 , $\text{CON}(\text{CH}_3)_2$, Cl, F, OCH_3 , CN, OH, CH_2OH , CH_3 , $\text{C}(\text{CH}_3)_3$) or a heterocyclic group

selected from benzofuranyl, quinolinyl, , pyrimidinyl, thiophenyl, benzothiophenyl, isoxazolyl, pyridinyl (each of which is substituted or is substituted once by a group selected from $-\text{OCH}_3$, CH_3 , F).

In a further embodiment, Z is phenyl (which is unsubstituted or substituted once by a substituent selected from phenyl, OCH_2 phenyl, NHSO_2CH_3 , NHCOCH_3 , CONH_2 , $\text{CON}(\text{CH}_3)_2$, Cl, F, OCH_3 , CN, OH, CH_2OH , CH_3 , $\text{C}(\text{CH}_3)_3$).

In a further embodiment Z is phenyl.

In one embodiment, R^2 is H or Y^1Z^1 .

In one embodiment, R^2 is Y^1Z^1 .

In one embodiment Y^1 is a bond, (i.e. is absent), or C_{1-3} alkylene.

In one embodiment Y^1 is a bond.

In one embodiment Z^1 is H, halogen, phenyl (unsubstituted or substituted by one substituent selected from NHSO_2R^6 , CONR^7R^8 , CF_3 , C_{1-3} alkoxy, SO_2R^6 , NHCOR^7 , $\text{SO}_2\text{NR}^7\text{R}^8$, NR^7R^8) or a 6 membered heterocyclic group which contains one nitrogen atom (which is unsubstituted or substituted one time by a group selected from C_{1-3} alkyl, $-\text{CH}_2$ phenyl, SO_2R^6 , CONR^7R^8).

In one embodiment Z^1 is a 6 membered heterocyclyl optionally substituted by one or more substituents as described above. Preferably Z^1 is a 6 membered heterocyclyl substituted by $-\text{SO}_2\text{R}^6$ wherein R^6 is as defined above. Most preferably the 6 membered heterocyclyl is 4-piperidyl.

In a further aspect of the present invention, there is provided a compound of Formula (Ia):

wherein R^1 represents H, halogen, or a group $-YZ$;

Y represents a bond (i.e. is absent), C_{1-6} alkylene or C_{2-6} alkenylene;

Z represents an aryl or heteroaryl group each comprising 5-14 ring members, said aryl or heteroaryl being optionally substituted by one or more substituents independently selected from halogen, OH, C_{1-6} alkyl, C_{1-6} haloalkyl, C_{1-6} alkoxy, C_{1-6} haloalkoxy, CN, C_{1-6} hydroxyalkyl, phenyl, O- C_{1-6} alkyl-phenyl, $NHSO_2R^3$, $NHCOR^3$, $CONR^4R^5$, $SO_2NR^4R^5$;

R^3 , R^4 and R^5 independently represent H or C_{1-6} alkyl;

R^2 represents H, halogen or a group $-Y^1Z^1$;

Y^1 represents a bond (i.e. is absent), C_{1-6} alkylene, C_{2-6} alkenylene;

Z^1 represents a 6 membered aryl, 5 or 6 membered heteroaryl, 5 - 7 membered heterocyclyl, C_{5-7} cycloalkyl, C_{5-7} cycloalkenyl, each of which may be optionally substituted by one or more substituents independently selected from SO_2R^6 , $NHSO_2R^6$, COC_{1-6} alkyl, C_{1-6} alkyl, C_{1-6} haloalkyl, C_{1-6} alkoxy, C_{1-6} haloalkoxy, halogen, $CONR^7R^8$, $NHCOR^7$, or phenyl (directly attached or attached by a C_{1-6} alkylene, CONH, C_{2-6} alkenylene spacer and optionally substituted by one or more

substituent selected from C_{1-6} alkyl, C_{1-6} alkoxy, C_{1-6} haloalkyl, C_{1-6} haloalkoxy, OH, halogen);

R^6 represents H C_{1-6} alkyl, phenyl (optionally substituted by C_{1-6} alkyl, halogen, C_{1-6} haloalkyl, C_{1-6} haloalkoxy, C_{1-6} alkoxy);

R^7 and R^8 independently represents C_{1-8} alkyl, H, C_{1-8} alkylene NR^9R^{10} ;

R^9 and R^{10} independently represents C_{1-8} alkyl, H;

with the proviso R^1 and R^2 do not both represent H;
or a salt, solvate, or physiologically functional derivative thereof.

While embodiments for each variable have generally been listed above separately for each variable, compounds of this invention includes those in each variable in formula (I) may be independently selected from each described embodiment for each variable. Therefore, this invention is intended to include all combinations of embodiments for each variable. Examples are described below.

Thus, in one embodiment, R^1 is YZ and R^2 is H or Br, wherein YZ includes all combinations of embodiments described above for Y and Z.

In a further embodiment, R^1 is phenyl or Br and R^2 is Y^1Z^1 wherein Y^1Z^1 includes all combinations of embodiments described above for Y^1 and Z^1 .

In a further embodiment R^1 is YZ and R^2 is Y^1Z^1 wherein YZ and Y^1Z^1 include all combinations of embodiments described above for YZ and Y^1Z^1 .

Specific examples of compounds of the present invention include the following:

5-phenyl-1H-indole-7-carboxamide;
5-(4-biphenyl)-1H-indole-7-carboxamide;
5-{4-[(phenylmethyl)oxy]phenyl}-1H-indole-7-carboxamide;
5-{4-[(methylsulfonyl)amino]phenyl}-1H-indole-7-carboxamide;
5-[4-(acetylamino)phenyl]-1H-indole-7-carboxamide;
5-[3-(aminocarbonyl)phenyl]-1H-indole-7-carboxamide;
5-(4-chlorophenyl)-1H-indole-7-carboxamide;
5-[3-(acetylamino)phenyl]-1H-indole-7-carboxamide;
5-[3-(aminosulfonyl)phenyl]-1H-indole-7-carboxamide;
5-[3-[(dimethylamino)carbonyl]phenyl]-1H-indole-7-carboxamide;
5-(3-fluorophenyl)-1H-indole-7-carboxamide;

5-[3-(methyloxy)phenyl]-1H-indole-7-carboxamide;
5-(3-cyanophenyl)-1H-indole-7-carboxamide;
5-(3-hydroxyphenyl)-1H-indole-7-carboxamide;
5-(3-quinoliny)-1H-indole-7-carboxamide;
5-(1-benzofuran-4-yl)-1H-indole-7-carboxamide;
5-(1,3-benzodioxol-5-yl)-1H-indole-7-carboxamide;
5-[(E)-2-phenylethenyl]-1H-indole-7-carboxamide;
5-(5-pyrimidinyl)-1H-indole-7-carboxamide;
5-(3-biphenyl)-1H-indole-7-carboxamide;
5-(1-benzofuran-2-yl)-1H-indole-7-carboxamide;
5-(1-benzothien-2-yl)-1H-indole-7-carboxamide;
5-[3-(hydroxymethyl)phenyl]-1H-indole-7-carboxamide;
5-(2-naphthalenyl)-1H-indole-7-carboxamide;
5-(4-fluorophenyl)-1H-indole-7-carboxamide;
5-[6-(methyloxy)-3-pyridinyl]-1H-indole-7-carboxamide;
5-[4-(hydroxymethyl)phenyl]-1H-indole-7-carboxamide;
5-(3-chlorophenyl)-1H-indole-7-carboxamide;
5-(2-methylphenyl)-1H-indole-7-carboxamide;
5-[3-[(phenylmethyl)oxy]phenyl]-1H-indole-7-carboxamide;
5-(2-chlorophenyl)-1H-indole-7-carboxamide;
5-(3,5-dimethyl-4-isoxazolyl)-1H-indole-7-carboxamide;
5-[2-[(phenylmethyl)oxy]phenyl]-1H-indole-7-carboxamide;
5-(5-quinoliny)-1H-indole-7-carboxamide;
5-(1-naphthalenyl)-1H-indole-7-carboxamide;
3-bromo-5-phenyl-1H-indole-7-carboxamide;
3-iodo-5-phenyl-1H-indole-7-carboxamide;
3,5-diphenyl-1H-indole-7-carboxamide;
3-[4-[(methylsulfonyl)amino]phenyl]-5-phenyl-1H-indole-7-carboxamide;
5-phenyl-3-(3-pyridinyl)-1H-indole-7-carboxamide;
3-[4-[[[(2-aminoethyl)amino]carbonyl]phenyl]-5-phenyl-1H-indole-7-carboxamide;

or a salt, solvate, or physiologically functional derivative thereof.

As used herein, the term "optionally" means that the subsequently described event(s) may or may not occur, and includes both event(s), which occur, and events that do not occur.

As used herein, the term "physiologically functional derivative" refers to any pharmaceutically acceptable derivative of a compound of the present invention, for example, an ester or an amide, which upon administration to a mammal is capable of providing (directly or indirectly) a compound of the present invention or an active metabolite thereof. Such derivatives are clear to those skilled in the art, without undue experimentation, and with reference to the teaching of Burger's Medicinal Chemistry And Drug Discovery, 5th Edition, Vol 1: Principles and Practice, which is incorporated herein by reference to the extent that it teaches physiologically functional derivatives.

As used herein, the term "solvate" refers to a complex of variable stoichiometry formed by a solute (in this invention, a compound of formula (I) or a salt or physiologically functional derivative thereof) and a solvent. Such solvents for the purpose of the invention may not interfere with the biological activity of the solute. Examples of suitable solvents include, but are not limited to, water, methanol, ethanol and acetic acid. Preferably the solvent

used is a pharmaceutically acceptable solvent. Examples of suitable pharmaceutically acceptable solvents include, without limitation, water, ethanol and acetic acid. Most preferably the solvent used is water.

As used herein, the term "substituted" refers to substitution with the named substituent or substituents, multiple degrees of substitution being allowed unless otherwise stated.

Certain of the compounds described herein may contain one or more chiral atoms, or may otherwise be capable of existing as two enantiomers. The compounds of this invention include mixtures of enantiomers as well as purified enantiomers or enantiomerically enriched mixtures. Also included within the scope of the invention are the individual isomers of the compounds represented by formula (I) above as well as any wholly or partially equilibrated mixtures thereof. The present invention also covers the individual isomers of the compounds represented by the formulas above as mixtures with isomers thereof in which one or more chiral centers are inverted. Also, it is understood that any tautomers and mixtures of tautomers of the compounds of formula (I) are included within the scope of the compounds of formula (I).

The present invention also covers salt of the compounds of formula (I). Typically, the salts of the present invention are pharmaceutically acceptable salts. Salts encompassed within the term "pharmaceutically acceptable salts" refer to non-toxic salts of the compounds of this invention. Salts of the compounds of the present invention may comprise acid addition salts derived from a nitrogen on a substituent in the compound of formula (I). Representative salts include the following salts: acetate, benzenesulfonate, benzoate, bicarbonate, bisulfate, bitartrate, borate, bromide, calcium edetate, camsylate, carbonate, chloride, clavulanate, citrate, dihydrochloride, edetate, edisylate, estolate, esylate, fumarate, gluceptate, gluconate, glutamate, glycolylarsanilate, hexylresorcinate, hydrabamine, hydrobromide, hydrochloride, hydroxynaphthoate, iodide, isethionate, lactate, lactobionate, laurate, malate, maleate, mandelate, mesylate, methylbromide, methylnitrate, methylsulfate, monopotassium maleate, mucate, napsylate, nitrate, N-methylglucamine, oxalate, pamoate (embonate), palmitate, pantothenate, phosphate/diphosphate, polygalacturonate, potassium, salicylate, sodium, stearate, subacetate, succinate, tannate, tartrate, teoclate, tosylate, triethiodide, trimethylammonium and valerate. Other salts, which are not pharmaceutically acceptable, may be useful in the preparation of compounds of this invention and these form a further aspect of the invention.

While it is possible that, for use in therapy, therapeutically effective amounts of a compound of formula (I), as well as salts, solvates and physiological functional derivatives thereof, may be administered as the raw chemical, it is possible to present the active ingredient as a pharmaceutical composition. Accordingly, the invention further provides a pharmaceutical composition, which comprises a compound of formula (I) and salts, solvates and physiological functional derivatives thereof, and one or more pharmaceutically acceptable carriers, diluents, or excipients. The compounds of the formula (I) and salts, solvates and physiological functional derivatives thereof, are as described above. The carrier(s), diluent(s) or excipient(s) must be acceptable in the sense of being compatible with the other ingredients of the formulation and not deleterious to the recipient thereof. In accordance with another aspect of the invention there is also provided a process for the preparation of a pharmaceutical composition including admixing a compound of the formula (I), or salts, solvates and physiological functional derivatives thereof, with one or more pharmaceutically acceptable carriers, diluents or excipients.

Pharmaceutical compositions may be presented in unit dose forms containing a predetermined amount of active ingredient per unit dose. Such a unit may contain, for example, 0.5mg to 1g, preferably 1mg to 700mg, more preferably 5mg to 100mg of a compound of the formula (I), depending on the condition being treated, the route of administration and the age, weight and condition of the patient, or pharmaceutical compositions may be presented in unit dose forms containing a predetermined amount of active ingredient per unit dose. Preferred unit dosage compositions are those containing a daily dose or sub-dose, as herein above recited, or an appropriate fraction thereof, of an active ingredient. Furthermore, such pharmaceutical compositions may be prepared by any of the methods well known in the pharmacy art.

Pharmaceutical compositions may be adapted for administration by any appropriate route, for example by the oral (including buccal or sublingual), rectal, nasal, topical (including buccal, sublingual or transdermal), vaginal or parenteral (including subcutaneous, intramuscular, intravenous or intradermal) route. Such formulations may be prepared by any method known in the art of pharmacy, for example by bringing into association the active ingredient with the carrier(s) or excipient(s).

Pharmaceutical compositions adapted for oral administration may be presented as discrete units such as capsules or tablets; powders or granules; solutions or suspensions in aqueous or non-aqueous liquids; edible foams or whips; or oil-in-water liquid emulsions or water-in-oil liquid emulsions.

For instance, for oral administration in the form of a tablet or capsule, the active drug component can be combined with an oral, non-toxic pharmaceutically acceptable inert carrier such as ethanol, glycerol, water and the like. Powders are prepared by comminuting the compound to a suitable fine size and mixing with a similarly comminuted pharmaceutical carrier such as an edible carbohydrate, as, for example, starch or mannitol. Flavoring, preservative, dispersing and coloring agent can also be present.

Capsules are made by preparing a powder mixture, as described above, and filling formed gelatin sheaths. Glidants and lubricants such as colloidal silica, talc, magnesium stearate, calcium stearate or solid polyethylene glycol can be added to the powder mixture before the filling operation. A disintegrating or solubilizing agent such as agar-agar, calcium carbonate or sodium carbonate can also be added to improve the availability of the medicament when the capsule is ingested.

Moreover, when desired or necessary, suitable binders, lubricants, disintegrating agents and coloring agents can also be incorporated into the mixture. Suitable binders include starch, gelatin, natural sugars such as glucose or beta-lactose, corn sweeteners, natural and synthetic gums such as acacia, tragacanth or sodium alginate, carboxymethylcellulose, polyethylene glycol, waxes and the like. Lubricants used in these dosage forms include sodium oleate, sodium stearate, magnesium stearate, sodium benzoate, sodium acetate, sodium chloride and the like. Disintegrators include, without limitation, starch, methyl cellulose, agar, bentonite, xanthan gum and the like. Tablets are formulated, for example, by preparing a powder mixture, granulating or slugging, adding a lubricant and disintegrant and pressing into tablets. A powder mixture is prepared by mixing the compound, suitably comminuted, with a diluent or base as described above, and optionally, with a binder such as carboxymethylcellulose, an aliginate, gelatin, or polyvinyl pyrrolidone, a solution retardant such as paraffin, a resorption accelerator such as a quaternary salt and/or an absorption agent such as bentonite, kaolin or dicalcium phosphate. The powder mixture can be granulated by wetting with a binder such as syrup, starch paste, acadia mucilage or solutions of cellulosic or polymeric materials and forcing through a screen. As an alternative to granulating, the powder mixture can be run through

the tablet machine and the result is imperfectly formed slugs broken into granules. The granules can be lubricated to prevent sticking to the tablet forming dies by means of the addition of stearic acid, a stearate salt, talc or mineral oil. The lubricated mixture is then compressed into tablets. The compounds of the present invention can also be combined with a free flowing inert carrier and compressed into tablets directly without going through the granulating or slugging steps. A clear or opaque protective coating consisting of a sealing coat of shellac, a coating of sugar or polymeric material and a polish coating of wax can be provided. Dyestuffs can be added to these coatings to distinguish different unit dosages.

Oral fluids such as solution, syrups and elixirs can be prepared in dosage unit form so that a given quantity contains a predetermined amount of the compound. Syrups can be prepared by dissolving the compound in a suitably flavored aqueous solution, while elixirs are prepared through the use of a non-toxic alcoholic vehicle. Suspensions can be formulated by dispersing the compound in a non-toxic vehicle. Solubilizers and emulsifiers such as ethoxylated isostearyl alcohols and polyoxy ethylene sorbitol ethers, preservatives, flavor additive such as peppermint oil or natural sweeteners or saccharin or other artificial sweeteners, and the like can also be added.

Where appropriate, dosage unit compositions for oral administration can be microencapsulated. The formulation can also be prepared to prolong or sustain the release as for example by coating or embedding particulate material in polymers, wax or the like.

The compounds of formula (I), and salts, solvates and physiological functional derivatives thereof, can also be administered in the form of liposome delivery systems, such as small unilamellar vesicles, large unilamellar vesicles and multilamellar vesicles. Liposomes can be formed from a variety of phospholipids, such as cholesterol, stearylamine or phosphatidylcholines.

The compounds of formula (I) and salts, solvates and physiological functional derivatives thereof may also be delivered by the use of monoclonal antibodies as individual carriers to which the compound molecules are coupled. The compounds may also be coupled with soluble polymers as targetable drug carriers. Such polymers can include polyvinylpyrrolidone, pyran copolymer, polyhydroxypropylmethacrylamide -phenol, polyhydroxyethylaspartamidephenol, or polyethyleneoxidepolylysine substituted with

palmitoyl residues. Furthermore, the compounds may be coupled to a class of biodegradable polymers useful in achieving controlled release of a drug, for example, polylactic acid, polyepsilon caprolactone, polyhydroxy butyric acid, polyorthoesters, polyacetals, polydihydropyrans, polycyanoacrylates and cross-linked or amphipathic block copolymers of hydrogels.

Pharmaceutical compositions adapted for transdermal administration may be presented as discrete patches intended to remain in intimate contact with the epidermis of the recipient for a prolonged period of time. For example, the active ingredient may be delivered from the patch by iontophoresis as generally described in Pharmaceutical Research, 3(6), 318 (1986).

Pharmaceutical compositions adapted for topical administration may be formulated as ointments, creams, suspensions, lotions, powders, solutions, pastes, gels, sprays, aerosols or oils.

For treatments of the eye or other external tissues, for example mouth and skin, the compositions are preferably applied as a topical ointment or cream. When formulated in an ointment, the active ingredient may be employed with either a paraffinic or a water-miscible ointment base. Alternatively, the active ingredient may be formulated in a cream with an oil-in-water cream base or a water-in-oil base.

Pharmaceutical compositions adapted for topical administrations to the eye include eye drops wherein the active ingredient is dissolved or suspended in a suitable carrier, especially an aqueous solvent.

Pharmaceutical compositions adapted for topical administration in the mouth include lozenges, pastilles and mouth washes.

Pharmaceutical compositions adapted for rectal administration may be presented as suppositories or as enemas.

Pharmaceutical compositions adapted for nasal administration wherein the carrier is a solid include a coarse powder having a particle size for example in the range 20 to 500 microns which is administered in the manner in which snuff is taken, i.e. by rapid inhalation through the nasal passage from a container of the powder held close up to the

nose. Suitable compositions wherein the carrier is a liquid, for administration as a nasal spray or as nasal drops, include aqueous or oil solutions of the active ingredient.

Pharmaceutical compositions adapted for administration by inhalation include fine particle dusts or mists, which may be generated by means of various types of metered, dose pressurised aerosols, nebulizers or insufflators.

Pharmaceutical compositions adapted for vaginal administration may be presented as pessaries, tampons, creams, gels, pastes, foams or spray formulations.

Pharmaceutical compositions adapted for parenteral administration include aqueous and non-aqueous sterile injection solutions which may contain anti-oxidants, buffers, bacteriostats and solutes which render the formulation isotonic with the blood of the intended recipient; and aqueous and non-aqueous sterile suspensions which may include suspending agents and thickening agents. The compositions may be presented in unit-dose or multi-dose containers, for example sealed ampoules and vials, and may be stored in a freeze-dried (lyophilized) condition requiring only the addition of the sterile liquid carrier, for example water for injections, immediately prior to use. Extemporaneous injection solutions and suspensions may be prepared from sterile powders, granules and tablets.

It should be understood that in addition to the ingredients particularly mentioned above, the compositions may include other agents conventional in the art having regard to the type of composition in question, for example those suitable for oral administration may include flavouring agents.

A therapeutically effective amount of a compound of the present invention will depend upon a number of factors including, for example, the age and weight of the animal, the precise condition requiring treatment and its severity, the nature of the formulation, and the route of administration, and will ultimately be at the discretion of the attendant physician or veterinarian. However, an effective amount of a compound of formula (I) for the treatment of neoplastic growth, for example colon or breast carcinoma, will generally be in the range of 0.1 to 100 mg/kg body weight of recipient (mammal) per day and more usually in the range of 1 to 10 mg/kg body weight per day. Thus, for a 70kg adult mammal, the actual amount per day would usually be from 70 to 700 mg and this amount may be given in a single dose per day or more usually in a number (such as two, three,

four, five or six) of sub-doses per day such that the total daily dose is the same. An effective amount of a salt or solvate, or physiologically functional derivative thereof, may be determined as a proportion of the effective amount of the compound of formula (I) *per se*. It is envisaged that similar dosages would be appropriate for treatment of the other conditions referred to above.

The compounds of formula (I) and salts, solvates and physiological functional derivatives thereof, are believed to have utility in inflammatory and tissue repair disorders, particularly rheumatoid arthritis, inflammatory bowel disease, asthma and COPD (chronic obstructive pulmonary disease); osteoarthritis, osteoporosis and fibrotic diseases; dermatosis, including psoriasis, atopic dermatitis and ultraviolet radiation (UV)-induced skin damage; autoimmune diseases including systemic lupus erythematosus, multiple sclerosis, psoriatic arthritis, ankylosing spondylitis, tissue and organ rejection, Alzheimer's disease, stroke, atherosclerosis, restenosis, diabetes, glomerulonephritis, cancer, including Hodgkins disease, cachexia, inflammation associated with infection and certain viral infections, including acquired immune deficiency syndrome (AIDS), adult respiratory distress syndrome, and Ataxia Telangiectasia as a result of inhibition of the protein kinase IKK2.

The present invention thus also provides compounds of formula (I) and pharmaceutically acceptable salts or solvates thereof, or physiologically functional derivatives thereof, for use in medical therapy, and particularly in the treatment of disorders mediated by IKK2 activity.

The inappropriate IKK2 activity referred to herein is any IKK2 activity that deviates from the normal IKK2 activity expected in a particular mammalian subject. Inappropriate IKK2 activity may take the form of, for instance, an abnormal increase in activity, or an aberration in the timing and or control of IKK2 activity. Such inappropriate activity may result then, for example, from overexpression or mutation of the protein kinase leading to inappropriate or uncontrolled activation.

The present invention is directed to methods of regulating, modulating, or inhibiting IKK2 for the prevention and/or treatment of disorders related to unregulated IKK2 activity. In particular, the compounds of the present invention can also be used in the treatment of certain forms of renal and cardiovascular disease as well as congestive heart failure.

A further aspect of the invention provides a method of treatment of a mammal suffering from a disorder mediated by IKK2 activity, which includes administering to said subject a compound of formula (I) or a pharmaceutically acceptable salt, solvate, or a physiologically functional derivative thereof. In a preferred embodiment, the disorder is a susceptible cancer.

A further aspect of the present invention provides the use of a compound of formula (I), or a pharmaceutically acceptable salt or solvate thereof, or a physiologically functional derivative thereof, in the preparation of a medicament for the treatment of a disorder characterized by inappropriate IKK2 activity.

Particular disorders characterised by inappropriate IKK2 activity include inflammatory and tissue repair disorders, particularly rheumatoid arthritis, inflammatory bowel disease, asthma and COPD (chronic obstructive pulmonary disease); osteoarthritis, osteoporosis and fibrotic diseases; dermatosis, including psoriasis, atopic dermatitis and ultraviolet radiation (UV)-induced skin damage; autoimmune diseases including systemic lupus erythematosus, multiple sclerosis, psoriatic arthritis, ankylosing spondylitis, tissue and organ rejection, Alzheimer's disease, stroke, atherosclerosis, restenosis, diabetes, glomerulonephritis, cancer, including Hodgkins disease, cachexia, inflammation associated with infection and certain viral infections, including acquired immune deficiency syndrome (AIDS), adult respiratory distress syndrome, and Ataxia Telangiectasia as a result of inhibition of the protein kinase IKK2.

Particular disorders are an inflammatory or tissue repair disorder, most particularly rheumatoid arthritis, inflammatory bowel disease, asthma, and COPD (chronic obstructive pulmonary disease).

In a still further aspect, the disorder is selected from the group consisting of autoimmune diseases; tissue and organ rejection, Alzheimer's disease, stroke, atherosclerosis, restenosis, diabetes, glomerulonephritis, osteoarthritis, osteoporosis, and Ataxia Telangiectasia. Most particularly the disorder is an autoimmune disease including systemic lupus erythematosus, multiple sclerosis, psoriatic arthritis, or ankylosing spondylitis, diabetes.

In a still further aspect, the disease is cachexia or cancer, more particularly Hodgkins disease.

The compounds of this invention may be made by a variety of methods, including standard chemistry. Any previously defined variable will continue to have the previously defined meaning unless otherwise indicated. Illustrative general synthetic methods are set out below and then specific compounds of the invention are prepared in the Working Examples.

Compounds of general formula (I) may be prepared by methods known in the art of organic synthesis as set forth in part by the following synthesis schemes. In all of the schemes described below, it is well understood that protecting groups for sensitive or reactive groups are employed where necessary in accordance with general principles of chemistry. Protecting groups are manipulated according to standard methods of organic synthesis (T. W. Green and P. G. M. Wuts (1991) Protecting Groups in Organic Synthesis, John Wiley & Sons). These groups are removed at a convenient stage of the compound synthesis using methods that are readily apparent to those skilled in the art. The selection of processes as well as the reaction conditions and order of their execution shall be consistent with the preparation of compounds of Formula (I). Those skilled in the art will recognize if a stereocenter exists in compounds of Formula (I). Accordingly, the present invention includes both possible stereoisomers and includes not only racemic compounds but the individual enantiomers as well. When a compound is desired as a single enantiomer, it may be obtained by stereospecific synthesis or by resolution of the final product or any convenient intermediate. Resolution of the final product, an intermediate, or a starting material may be effected by any suitable method known in the art. See, for example, Stereochemistry of Organic Compounds by E. L. Eliel, S. H. Wilen; and L. N. Mander (Wiley-Interscience, 1994).

Compounds of Formula I can be prepared for example according to Scheme 1 depicted below and the Examples section following:

Scheme 1

- a) $\text{O}[\text{CO}_2\text{C}(\text{CH}_3)_3]_2$, THF, rt.
- b) i) *s*-Butyl lithium, TMEDA.
ii) $\text{MeOC}(\text{O})\text{Cl}$, -78°C to r.
- c) NBS, CH_2Cl_2 , rt.
- d) i) TFA, rt.
ii) MnO_2 , THF, rt.
- e) $\text{LiOH}(\text{aq})$, MeOH, rt.
- f) HATU, NH_3 , DIPEA, Dioxane- CH_2Cl_2 , rt.
- g) $\text{O}[\text{CO}_2\text{C}(\text{CH}_3)_3]_2$, DMAP, CH_2Cl_2 , rt.
- h) i) $\text{ArB}(\text{OH})_2$, K_2CO_3 , $\text{PdCl}_2(\text{dppf})$, CH_2Cl_2 , DMF.
ii) HCl, EtOH, 150°C .
- i) i) represents a ketone or aldehyde condensation reaction which produces a compound where R^2 includes an alkyl derivative directly attached to the ring. KOH or NaOMe, MeOH, 65° .
- j) NIS, CH_2Cl_2 , rt.
- k) i) represents a Suzuki coupling to introduce R^2 including aryl or heteroaryl moieties, e.g. $\text{O}[\text{CO}_2\text{C}(\text{CH}_3)_3]_2$, DMAP, CH_2Cl_2 , rt.
ii) $\text{ArB}(\text{OH})_2$, K_2CO_3 , $\text{PdCl}_2(\text{dppf})$, CH_2Cl_2 , DMF, 8.
iii) HCl, EtOH, 150°C .
- l) i) $\text{ArB}(\text{OH})_2$, K_2CO_3 (or) Cs_2CO_3 , $(\text{Ph}_3\text{P})_4\text{Pd}$, Dioxane, water.

Compounds of Formula I represented by example 57 may be prepared according to Scheme 2.

Scheme 2

- a). i) 1-methyl-2-pyrrolidine, POCl_3 , 15°C to 80°C
 ii) EtOH , NaBH_4
 b). $\text{LiOH} \cdot 2\text{H}_2\text{O}$, MeOH , HCl , reflux
 c). O -(7-Azabenzotriazol-1-yl)- N,N,N',N' -tetramethyluronium-hexafluorophosphate, NH_3 , dioxane

Alternatively, compounds of Formula I represented by example 58 may be prepared according to Scheme 3.

Scheme 3

- a) HOAc, H₃PO₄, maleimide, reflux
 b) LAH, THF, reflux
 c) Et₃N, (BOC)₂O, Dichloromethane
 d) i) THF, MnO₂
 ii) Ag₂O, NaCN, MeOH, HCl
 e) i) LiOH·2H₂O, MeOH
 ii) O-(7-Azabenzotriazol-1-yl)-N,N,N',N'-tetramethyluronium - hexafluorophosphate, NH₃, MeOH
 f) i) TFA, THF
 ii) ClSO₂Et, Et₃N, DCM

Reaction conditions will be apparent to a skilled person and Examples of suitable conditions are further exemplified in the Examples Section below. It will also be evident from the above scheme that a compound of formula (I) may be converted into another compound of formula (I) using conventional procedures. It will also be evident to the skilled artisan that the reaction sequence may be rearranged from that depicted in the general scheme. Thus incorporation of substituent R² may occur before R¹. Alternatively, R¹ may be installed prior to the conversion of the carboxylic acid to the amide.

Certain embodiments of the present invention will now be illustrated by way of example only. The physical data given for the compounds exemplified is consistent with the assigned structure of those compounds.

EXAMPLES

As used herein the symbols and conventions used in these processes, schemes and examples are consistent with those used in the contemporary scientific literature, for example, the *Journal of the American Chemical Society* or the *Journal of Biological Chemistry*. Standard single-letter or three-letter abbreviations are generally used to designate amino acid residues, which are assumed to be in the L-configuration unless otherwise noted. All references to ether are to diethyl ether; brine refers to a saturated aqueous solution of NaCl. Unless otherwise indicated, all temperatures are expressed in °C (degrees Centigrade). All reactions are conducted under an inert atmosphere at room temperature unless otherwise noted.

¹H NMR spectra were recorded on a Bruker DPX400, a Bruker DPX250, a Bruker AC400, or a Varian Inova 400. Chemical shifts are expressed in parts per million (ppm, δ units). Splitting patterns describe apparent multiplicities and are designated as s (singlet), d (doublet), t (triplet), q (quartet), quint (quintet), m (multiplet), br (broad).

Low-resolution mass spectra (MS) were recorded on a JOEL JMS-AX505HA, JOEL SX-102, or a SCIEX-APIiii spectrometer; LC-MS were recorded on Waters ZQ or PE Sciex Single Quadrupole LC/MS API-150 spectrometers.

Preparative HPLC refers to methods where the material was purified by high performance liquid chromatography on a HPLC ABZ+ 5 μ m column (10 cm x 21.2 mm i.d.) with 0.1% formic acid in water and 0.05% formic acid in acetonitrile utilising gradient elution at a flow rate of 8 ml/min and UV detection at 254nm.

Unless otherwise stated, silica flash column chromatography and Combiflash refers to the purification of material using RedisepTM pre-packed silica flash columns on an ISCO sq16x machine with the stated solvent systems.

Reverse phase HPLC method A refers to methods where the materials were purified by high performance liquid chromatography on an HPLC S-5 μ m column (75x30 mm i.d.) utilizing gradient elution with the stated solvent systems and UV detection at 254 nm.

Reverse phase HPLC method B refers to methods where the materials was purified by high performance liquid chromatography on a HPLC Luna C18 (2) 100A column (50x21.2 mm i.d.) utilizing gradient elution with the stated solvent system and UV detection at 254 nm.

Intermediates

Some of the compounds listed below as "Intermediates" also fall within the scope of Formula (I) and are thus also compounds of the invention as well as useful in preparing further compounds of Formula (I).

(1) 1,1-dimethylethyl 2,3-dihydro-1H-indole-1-carboxylate

Indoline (10 g, 84 mmol) was dissolved in tetrahydrofuran (100 mL) and di-tert-butylcarbonate (22 g, 0.1 mol) was added. The mixture was left stirring for 16 hours at room temperature under an inert nitrogen atmosphere. The tetrahydrofuran was removed *in vacuo* and the crude product purified by vacuum distillation to give the title compound (15.1 g) as a clear pale pink oil that crystallised upon standing (temperature: 160-162°C, pressure 1 - 0.1 mm Hg).

¹H NMR (400 MHz, DMSO-D₆) δ ppm 1.50 (s, 9 H) 3.04 (t, $J=8.7$ Hz, 2 H) 3.89 (t, $J=8.8$ Hz, 2 H) 6.91 (td, $J=7.3, 0.8$ Hz, 1 H) 7.13 (t, $J=7.5$ Hz, 1 H) 7.18 (d, $J=7.3$ Hz, 1 H) 7.5-7.8 (bs, 1 H) r.t. 3.44 min.

(2) 1-(1,1-dimethylethyl) 7-methyl 2,3-dihydro-1H-indole-1,7-dicarboxylate

1,1-dimethylethyl 2,3-dihydro-1H-indole-1-carboxylate (5 g, 22.8 mmol) and *N,N,N',N'*-tetramethyl-1,2-ethanediamine (4.6 mL, 30.5 mmol) was dissolved in dry diethyl ether (300 mL) and cooled to -78°C in an acetone/dry ice bath. *Sec*-butyl lithium (1.4 M solution in cyclohexane, 17.6 mL, 24.6 mmol) was added dropwise over 10 minutes and the reaction left stirring for 90 minutes at this temperature. Methyl chloroformate (8.8 mL, 10.8 g, 0.1 mol) was added to the mixture and the reaction was allowed to warm up to room temperature over 1 hour. Water was added carefully to the mixture and the organic layer separated and washed 3 times with more water. The organic layer was dried over magnesium sulfate, filtered and concentrated *in vacuo* to give the title compound (4.91 g) as a gummy yellow solid.

¹H NMR (400 MHz, DMSO-D₆) δ ppm 1.44 (s, 9 H) 3.06 (t, $J=8.2$ Hz, 2 H) 3.69 (s, 3 H) 4.02 (t, $J=8.3$ Hz, 2 H) 7.06 (t, $J=7.5$ Hz, 1 H) 7.35 (d, $J=7.5$ Hz, 1 H) 7.39 (dd, $J=7.4, 1.1$ Hz, 1 H) MS m/z 278 (M+1)⁺ r.t. 3.18 min.

(3) 1-(1,1-dimethylethyl) 7-methyl 5-bromo-2,3-dihydro-1H-indole-1,7-dicarboxylate

1-(1,1-dimethylethyl) 7-methyl 2,3-dihydro-1H-indole-1,7-dicarboxylate (3.1 g, 11.2 mmol) and N-bromosuccinimide (2.0 g, 11.2 mmol) were dissolved in dry dichloromethane (100 mL) and stirred under a nitrogen atmosphere at room temperature for 16 hours. The reaction was partitioned with sodium hydroxide solution (2 M), separated and washed with more sodium hydroxide solution. The organic layer was dried over magnesium sulfate and concentrated *in vacuo* to give the title compound as a gummy red solid (3.55 g).

¹H NMR (400 MHz, DMSO-D₆) δ ppm 1.41 (s, 9 H) 3.09 (t, $J=8.3$ Hz, 2 H) 3.70 (s, 3 H) 4.02 (t, $J=8.3$ Hz, 2 H) 7.46 (s, 1 H) 7.60 (s, 1 H) MS m/z 356/358 (1:1 ratio) ($M+1$)⁺ r.t. 3.52 min.

(4) methyl 5-bromo-2,3-dihydro-1H-indole-7-carboxylate

1-(1,1-dimethylethyl) 7-methyl 5-bromo-2,3-dihydro-1H-indole-1,7-dicarboxylate (9 g, 25 mmol) was dissolved in trifluoroacetic acid (6 mL) and stirred at room temperature for 16 hours. Dichloromethane and sodium hydroxide solution (2 M) were added and the organic layer washed twice with sodium hydroxide solution until the aqueous layer pH > 7. The organic layer was then concentrated *in vacuo* to give the title compound as a brown solid (6.5 g).

¹H NMR (400 MHz, DMSO-D₆) δ ppm 2.99 (t, $J=8.5$ Hz, 2 H) 3.61 (t, $J=8.4$ Hz, 2 H) 3.78 (s, 3 H) 6.72 (s, 1 H) 7.28 (d, $J=1$ Hz, 1 H) 7.46 (d, $J=2$ Hz, 1 H) MS m/z 256/258 (1:1 ratio) ($M+1$)⁺ r.t. 3.32 min.

(5) methyl 5-bromo-1H-indole-7-carboxylate

Methyl 5-bromo-2,3-dihydro-1H-indole-7-carboxylate (6.5 g, 25 mmol) was dissolved in tetrahydrofuran (100 mL). Activated manganese dioxide (5 μ m particle size, 22 g, 0.25 mol) was added and the mixture stirred at room temperature for 16 hours. A further 22 g of activated manganese dioxide was added and the reaction stirred for 96 hours. The reaction was then filtered through celite and concentrated *in vacuo* to give the title compound (5.1 g) as a beige solid.

¹H NMR (400 MHz, DMSO-D₆) δ ppm 3.94 (s, 3 H) 6.58 (d, $J=3$ Hz, 1 H) 7.48 (d, $J=3$ Hz, 1 H) 7.8 (d, $J=2$ Hz, 1 H) 8.07 (d, $J=1.8$ Hz, 1 H) 11.39 (bs, 1 H) MS m/z 252/254 (1:1 ratio) (M-1) r.t. 3.41 min.

(6) 5-bromo-1H-indole-7-carboxylic acid

5-bromo-1H-indole-7-carboxylate (5 g, 19.7 mmol) was dissolved in methanol (200 mL) and a solution of lithium hydroxide (0.99 g, 41 mmol) in water (10 mL) was added. The mixture was heated at reflux for 50 hours. The methanol was removed *in vacuo* and the residue diluted with aqueous hydrochloric acid (2 M). The resulting precipitate was filtered off and dried in a heated vacuum pistol to give the title compound as a beige solid (4.7 g).

¹H NMR (400 MHz, DMSO-D₆) δ ppm 6.54 (dd, $J=2.0, 3.2$ Hz, 1 H) 7.42 (t, $J=2.8$ Hz, 1 H) 7.77 (d, $J=2$ Hz, 1 H) 8.03 (d, $J=1.8$ Hz, 1 H) 11.27 (s, 1 H) 13.1-13.7 (bs, 1 H) MS m/z 238/240 (1:1 ratio) (M-1) r.t. 3.41 min.

(7) 5-bromo-1H-indole-7-carboxamide

5-bromo-1H-indole-7-carboxylic acid (20 g, 83.5 mmol), O-(7-Azabenzotriazol-1-yl)-N,N,N',N'-tetramethyluronium hexafluorophosphate (38 g, 100 mmol), ammonia solution in dioxane (0.5 M, 502 mL, 250 mmol) and di-isopropylethylamine (32.6 g, 44 mL, 250 mmol) were dissolved in dry dichloromethane (500 mL) and stirred at room temperature for 50 hours under a nitrogen atmosphere. The reaction mixture was then partitioned with saturated sodium bicarbonate solution, separated and washed with saturated brine solution. The organic layer was concentrated *in vacuo*, re-dissolved in methanol and pre-adsorbed onto silica. Purification was achieved by silica flash chromatography using an ethyl acetate-cyclohexane gradient system on an ISCO sq16x machine.

(10) Methyl 3-(1-methylpyrrolidin-2-yl)-5-phenyl-1H-indole-7-carboxylate

To 0.4 ml (4.0 mmol) of 1-methyl-2-pyrrolidine cooled in an ice bath was added 410.0 mg (2.6 mmol) of POCl₃ with stirring for 30min. The temperature was kept below 15°C. The mixture was stirred an additional 10min, and then a solution of 500.0 mg (2.0 mmol) of methyl 5-phenyl-1*H*-indole-7-carboxylate in 0.4 mL of 1-methyl-2-pyrrolidine was added slowly during 1 hr. The temperature rose to 45°C and a solid precipitated. The mixture was heated at 80°C for 2 hr and purified by combiflash to get methyl (3*Z*)-3-(1-methyl-2-pyrrolidinylidene)-5-phenyl-3*H*-indole-7-carboxylate 200.0 mg (30%).

A solution of methyl (3*Z*)-3-(1-methyl-2-pyrrolidinylidene)-5-phenyl-3*H*-indole-7-carboxylate (335.0 mg, 1.0 mmol) in EtOH (10.0 mL) was treated with NaBH₄ (124.0 mg, 3.0 mmol). The resulting solution was stirred at ambient temperature overnight after which time the solvent was removed under reduced pressure and water (5.0 mL) was added. The aqueous phase was extracted with CH₂Cl₂ (3×10mL). The organic phase was dried over Na₂SO₄, filtered and concentrated and the resulting crude product purified by flash chromatography (Ethyl acetate/Hexane 10%-60% v/v) to afford the title compound 330.0 mg (90%).

Examples

(1) 5-phenyl-1H-indole-7-carboxamide

General method A

1,1-dimethylethyl 7-[(bis[(1,1-dimethylethyl)oxy]carbonyl)amino]carbonyl]-5-bromo-1H-indole-1-carboxylate (50 mg, 92 μ mol), phenyl boronic acid (23 mg, 0.18 mmol), potassium carbonate (40 mg, 0.29 mmol) and 1,1'-bis(diphenylphosphino)ferrocenedichloropalladium (II) (4 mg, 4.9 μ mol) were combined in dimethylformamide (1 mL) and heated at 80 °C for 16 hours under nitrogen. The mixture was then pre-adsorbed onto silica and purified by silica flash chromatography using an ethyl acetate/cyclohexane elution system on an ISCO sq16x machine. The combined fractions were concentrated *in vacuo*, re-dissolved in ethanol (2 mL) and 15 μ L

concentrated hydrochloric acid added. The mixture was heated in a Smith synthesizer microwave for 5 minutes at 150°C then the solvent was removed *in vacuo* to give the title compound as a pink solid (12 mg).

1,1-dimethylethyl 7-[(bis{[(1,1-dimethylethyl)oxy]carbonyl}amino)carbonyl]-5-bromo-1H-indole-1-carboxylate (4.95 g, 9.18 mmol), phenyl boronic acid (3.36 g, 27.5 mmol), potassium carbonate (5.07 g, 36.7 mmol) and 1,1'-bis(diphenylphosphino)ferrocenedichloropalladium (II) (0.49 g, 0.6 mmol) were combined in dimethylformamide (70 mL) and heated at 80 °C for 17 hours under a nitrogen atmosphere. Further portions of phenyl boronic acid (1.12 g, 9.17 mmol), potassium carbonate (1.27 g, 9.18 mmol) and 1,1'-bis(diphenylphosphino)ferrocenedichloropalladium (II) (0.25 g, 0.3 mmol) were added, and heating continued for a further 21 hours. After cooling to room temperature and pre-adsorption onto silica, purification by silica flash chromatography using an ethyl acetate/cyclohexane elution system on an ISCO sq16x machine yielded 1,1-dimethylethyl 7-[(bis{[(1,1-dimethylethyl)oxy]carbonyl}amino)carbonyl]-5-phenyl-1H-indole-1-carboxylate (2.86 g, 5.33 mmol) and 1,1-dimethylethyl 7-[[[(1,1-dimethylethyl)oxy]carbonyl]amino]carbonyl]-5-phenyl-1H-indole-1-carboxylate (2.05 g, 4.70 mmol).

1,1-dimethylethyl 7-[[[(1,1-dimethylethyl)oxy]carbonyl]amino]carbonyl]-5-phenyl-1H-indole-1-carboxylate (2.05 g, 4.70 mmol) was dissolved in ethanol (30 mL) and dispensed equally into ten microwave vials, with the addition of concentrated hydrochloric acid (20 µL) to each tube. After sealing the tubes, each was heated in a Smith synthesizer microwave for 5 minutes at 150 °C. The combined material was pre-adsorbed onto silica *in vacuo*. Purification by silica chromatography using an ethyl acetate/cyclohexane gradient system on an ISCO sq16x machine yielded the title compound (333 mg) as a yellow solid.

A solution of K_2CO_3 (40 mg, 0.289 mmol) in H_2O (1.2 mL) was added to a slurry of 5-bromo-3-[1-(ethanesulfonyl)-4-piperidiny]-1*H*-indole-7-carboxamide (40 mg, 0.0965 mmol) in 1,4-dioxane (2.8 mL) in a CEM microwave vial. 3-Ethoxyphenylboronic acid (65 mg, 0.386 mmol) was then added, followed by chloro(di-2-norbornylphosphino)(2-dimethyl-aminomethylferrocen-1-yl)palladium (II) (1 mg, 0.00165 mmol). The vial was capped and heated in a CEM microwave for 10 min at 160 °C. The reaction was determined to be complete by LC/MS analysis. The reaction mixture was concentrated under a stream of nitrogen at 80 °C, and the crude product was dissolved in 1 mL DMSO. This solution was filtered through a 0.45 μ m PTFE membrane (Acrodisc) and then purified via preparative HPLC. Samples were purified using an Agilent 1100 Series LC with UV and MSD detection and fraction collection. DMSO solutions of crude products were injected onto a ZORBAX Eclipse XDB-C18 column (21.2 x 50 mm) and eluted over 10.6 min at a flow rate of 20 mL/min. Fraction collection was triggered by absorption at 214 nm. 7.9 mg (18%) of the title compound was recovered.

Chloro(di-2-norbornylphosphino)(2'-dimethylamino-1,1'-biphenyl-2-yl) palladium (II), (3 mg, 5 mol%) and a solution of K_3PO_4 (2 equiv) in H_2O (0.1 mL) were added to a solution of the 5-bromo-indolecarboxamide (24 mg, 0.1 mmol) in dioxane (1 mL). The aryl-boronic acid (3 equiv) was added and the mixture was stirred at 90 °C for 18 h and then at rt for 10 min. Chloroform (1.5 mL) and H_2O (0.5 mL) were added, and the layers were separated. The organic layer was concentrated under reduced pressure, and the crude residue was taken up in chloroform (1 mL). Polymer bound pyridine-hydrobromide-perbromide (55 mg, 0.11 mmol, Fluka) was added, and the mixture was agitated for 2 h. The reaction was filtered, and the resin was washed with chloroform (1.5 mL) and MeOH (1 mL). The filtrate was concentrated, and the crude product was purified via mass-directed reverse phase HPLC to give the desired compound.

Mass-Directed HPLC conditions:

Samples were purified using an Agilent 1100 Series LC with UV and MSD detection and fraction collection. Crude samples were dissolved in a 1:1 mixture of DMSO/methanol (600 μ L) for injection onto a ZORBAX Eclipse XDB-C18 column (21.2 x 50 mm) and eluted over ~10 min. at a flow rate of 20 mL/min. Fraction collection was triggered by absorption at 230 nm and triggering of the MSD at the MH^+ of the desired compound.

A mixture containing 5-phenyl-3-3-[(phenylmethyl)amino]cyclopentyl-1H-indole-7-carboxamide 170 mg, 0.42 mmol) ammonium formate (7 eq, 2.9 mmol, 183 mg) and 10% palladium on carbon (90 mg) in ethanol (4 mL) was stirred under nitrogen for 4hrs. Reaction was incomplete hence ammonium formate (90 mg) and 10% palladium on carbon (50 mg) in ethanol (2 mL) were added to the mixture and stirring was continued for a further 15hr. Reaction mixture was filtered through fibre glass filter paper. The filtrate was evaporated to dryness to give *the title compound* as an off-white solid. (76 mg).

(178) 3-{3-[(ethylsulfonyl)amino]cyclopentyl}-5-phenyl-1H-indole-7-carboxamide

To 3-(3-aminocyclopentyl)-5-phenyl-1H-indole-7-carboxamide (62 mg 0.19 mmol) was added pyridine (2 mL) and ethanesulfonyl chloride (1.2 eq, 0.23 mmol, 30 mg). Resultant orange solution was stirred at room temperature for 5hrs. The resultant mixture was quenched with saturated sodium bicarbonate and extracted with ethylacetate, then dried using hydrophobic frit and evaporated to dryness to give yellow oil which was then purified using MDAP to give the title compound as an orange solid (10 mg)

(179) 5-bromo-3-[1-(propylsulfonyl)-4-piperidiny]-1H-indole-7-carboxamide

To a solution of 5-bromo-3-(4-piperidiny)-1H-indole-7-carboxamide (406 mg, 1.26 mmol) in pyridine (20 mL) was added propanesulfonyl chloride (200 μ L, 2.04 mmol, 1.8 eq). Resultant mixture was heated at 90°C for 90hr. The mixture was evaporated to dryness and partitioned between 2N NaOH (200 mL), brine (15 mL) and dichloromethane (2 x 80 mL) and ethylacetate (2 x 70 mL). The combined organic extract was dried and evaporated to dryness to give a yellow oil which was purified by MDAP to give *the title compound* as a solid (6.7 mg).

(180) 5-bromo-3-(3-pyridinyl)-1H-indole-7-carboxamide

A solution of 1,1-dimethylethyl 7-[(bis{[(1,1-dimethylethyl)oxy]carbonyl}amino)carbonyl]-5-bromo-3-(3-pyridinyl)-1H-indole-1-carboxylate (70 mg, 0.11 mmol) in HCl in acetic acid (10 mL, 10 mmol, 90 eq) was stirred at room temperature for 2hr 30min. The resultant mixture was partitioned between 2N NaOH (30 mL), ethylacetate (2x10 mL),

dichloromethane (2x10 mL) and brine (5 mL). The organic extracts were combined, dried and concentrated *in vacuo* to give the title compound as a solid (12.2 mg).

(181) 5-bromo-3-[1-(methylsulfonyl)-1,2,3,6-tetrahydro-4-pyridinyl]-1H-indole-7-carboxamide

A mixture of 5-bromo-1H-indole-7-carboxamide (55 mg, 0.21 mmol) with 1-(methylsulfonyl)-4-piperidinone (112 mg, 0.678 mmol, 3 eq) in sodium methoxide in methanol,(3 mL, 1.5 mmol, 6 eq) was heated at reflux under nitrogen for 18hrs. The reaction mixture was evaporated to dryness and partitioned between 2N-NaOH (40 mL), brine (5 mL); dichloromethane (2x20 mL) and ethyl acetate (2x15 mL). The combined organic extract was dried, then evaporated to dryness. Purification by preparative chromatography gave the title compound as a solid (4.69 mg).

BIOLOGICAL DATA

IKK2 Assay

Recombinant human IKK2 (residues 1-737) was expressed in baculovirus as a C-terminal GST-tagged fusion protein, and its activity was assessed using a time-resolved fluorescence resonance energy transfer (TR-FRET) assay. Briefly, IKK2 (5 nM final) diluted in assay buffer (50 mM HEPES, 10 mM MgCl₂, 1 mM CHAPS pH 7.4 with 1 mM DTT and 0.01% w/v BSA) was added to wells containing various concentrations of compound or DMSO vehicle (3% final). The reaction was initiated by the addition of GST-IkB α substrate (25 nM final)/ATP (1 μ M final), in a total volume of 30 μ l. The reaction was incubated for 30 minutes at room temperature, then terminated by the addition of 15 μ l of 50 mM EDTA. Detection reagent (15 μ l) in buffer (100 mM HEPES pH 7.4, 150 mM NaCl and 0.1% w/v BSA) containing antiphosphoserine-IkB α -32/36 monoclonal antibody 12C2 (Cell Signalling Technology, Beverly Massachusetts, USA) labelled with W-1024 europium chelate (Wallac OY, Turku, Finland), and an APC-labelled anti-GST antibody (Prozyme, San Leandro, California, USA) was added and the reaction was further incubated for 60 minutes at room temperature. The degree of phosphorylation of GST-IkB α was measured using a Packard Discovery plate reader (Perkin-Elmer Life Sciences, Pangbourne, UK) as a ratio of specific 665 nm energy transfer signal to reference europium 620 nm signal.

Examples 1 ~ 182 (with the exception of Examples 3,32,33,35, 65, 81, 83, 154, 157, 158, 159, 161, 163 and 166) and compounds labelled as Intermediates 7, 24 and 30 were all found to have activity >4.8 in the above identified assay.
